

Ship design planning

I drew my schematics on pixel paper, writing out the coordinates in the margins. I used minimal colour coding and wrote a list of the layer order at the bottom. The notes above are sketches to visualize how I could use capsules to make the sails.

The drawing at the bottom was my rough sketch before using the pixel paper to precisely map the size. Above, I roughly wrote out my bullet point notes on the process. First I set up the window and set the background colour, then I drew the hull, bow, and stern. I had to do some tweaking for all three, the hull was too big and I had to fudge the numbers a bit for the bow and stern to get them to look good. Then I drew the masts. I initially planned to make all the sails triangles but I found out I could use 2 capsules instead, 1 for the sail and one to carve out the back of the sail, masking it as the sky. This took a lot of number fudging, since capsules have circular ends and you set the position based on the centre origin point. I was going to have the mizzen sail also a capsule but it looked cramped. Additionally, the black flag needs to go under the sail, with the 2 capsule method that would be impossible due to

the sky mask capsule. The triangle looks better too, gives it more visual variety. I added the sea, and the black flag, fudging some more numbers when drawing the skull on the flag. After drawing everything out, I started working on the interactive mechanics. I made it follow the mouse on the Y axis on left-click, and then learned how to make it move within a specific Y range, and stay on screen the whole time.
